Issued\_Patents\_AA Database :

chance to have a result being printed, Pred. No. is the number of results predicted by chance to becore greater than or equal to the score of the result being and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

molecules (PTAMS) given in AAN92317 to AAN82324. The PTAMS have cytostatic, antiarthritic, antialergic, antidiabetic, antilarpressant, antiarthritic, antiallergic, antidiabetic, antilipaemic, antirheumatic, osteopathic, dermatological, antianaemic, antipaemic, contropic, antigout, antialiarmatory and antiary activities, and protection transport. PTAM proteins and antagonists are useful for expression or activity of PTAM. PTAM polynucleotides are useful for expression or activity of PTAM. PTAM polynucleotides are useful for compression or activity of PTAM. PTAM polynucleotides are useful for complex, proposed with decreased or increased diagnosing conditions associated with PTAM, comprising detecting PTAM by comprising detecting pram by biological sample. Diseases prevented, treated or diagnosed include cell proliferative disorders such as cancers, immune disorders, secretory treated or disorders and other conditions associated with abnormal vestice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      trafficking, such as allergies, asthma, urticaria and autoimmune haemolytic anaemia. Anti-PTAM antibodies may be used as autoimmune a targeting or delivery mechanism for bringing pharmaceutical agents into cells or tissues expressing PTAM and for diagnosis of PTAM, red advisor and sor screening using libraries of compounds. PTAM, and the screening wing libraries of compounds. PTAM polynucleotides are useful for generating hybridisation proposed.
                                                                                                    New human protein transport-associated polypeptide and polynucleotide useful for diagnosis, prevention and treatment of cell proliferative and secretory disorders such as leukemia, cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful for generating hybridisation probes useful in mapping the naturally occurring genomic sequences.
                                                                                                                                                                                                                                                                              encode the human protein

The present invention describes a human trans-Golgi network protein designated hTGN48-iso. hTGN48-iso is expressed in tissue near liver cancer cells. Also described are methods for the preparation and detection of the hTGN480iso protein and nucleotide sequences. The present sequence represents the human hTGN48 protein which is used in comparison with the hTGN48-iso protein in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PKDVPNKSGAEKQTPKDGSNKSGAEEQGPIDGPSKSGAEEQTSKDSPNKVVPEQPSRKDH 262

The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (ABI99202 to ABI99912, encoding the protein sequences in ABB97020 to ABB97030 to ABI99912, encoding the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition improving drugs or therapeutics for ischaemic diseases. ABI99913 and ABI99914 represent PCR primers for a mouse ischaemic condition related sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ---GPSKSGAEEQTSKDSPNKVVPEQPSRKDHSKPISNPSDNK 273
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               737 AKSPAEAKSPIEVKSPEKAKTPVKEGAKSPAEAKSPEKA--KSPVKEDIKPPAEAKSPEK 794

```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pheumoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. Programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation is wide variety of organisms. The present sequence represents an

prokaryotic cellular proliferation, their use in identifying the genes their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruqinosa and Entercoccus faecalis. The form of a also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an avide variety of organisms.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated Staphylococcus Sdr cell wall proteins which bind both soluble and immobilized fibrinogen are useful for treating or preventing coagulase-negative staphylococcal infection such as scepticemia, osteomyelitis or endocarditis, and for inducing immune responses in patients. The cell wall proteins are also useful for reducing coagulase-negative staphylococci infection of induciling medical devices such as vascular grafts, vascular stents, intravenous catheters, artificial heart valves and cardiac assist devices. The cell wall associated proteins are able to inhibit cells present on the surface of implanted biomaterials.

combinations of bacterial binding proteins termed MSCRAMM (microbial surface components recognising adhesive matrix molecules) or their antibodies. A vaccine composition is provided that includes collagen binding protein or peptide, e.g. CNA, a fibrinogen binding protein or peptide, e.g. CNA, a fibrinogen binding protein composition is provided that includes collagen binding protein or peptide, e.g. CNA, a fibrinogen binding protein continually a fibromectin binding protein e.g. Febra, and optionally a fibromectin binding protein e.g. Febra, The vaccines are useful for imparting protection against a broad spectrum of Staphylococcus aureus, in an animal. The combinations can also be used to select donor blood pools for the present sequence is a serine-asparate repeat region protein, sdrf from Staphylococcus enidermidie
                                                                                                                                                                                                                                                                                           protein, SdrF from Staphylococcus epidermidis. The Sdr protein is useful in vaccine preparation in combination with specific bacterial binding proteins. These vaccines can be used to treat a broad spectrum of bacterial infections, including those arising from both coagulase-positive and coagulase-negative bacteria.

fibringgen binding protein, Ciff. Ciff is an important receptor anolyed in S. aureus colonisation of indwelling medical devices (e.g., catheters, artificial heart valves). Shortly after implantation, the surfaces of medical devices become coated with host plasma and matrix proteins such as fibringoen and fibronectin, and there is considerable evidence to suppose that bacterial adherence to fibringoen/fibring is important in the initiation of device-related infection. The fibringoen-binding region of Ciff is thought to reside between residues important in the initiation of Ciff is thought to reside between residues of fibringoen-binding region of Ciff is thought to reside between residues repeated region (region R) comprising 154 repeats of the dipeptide cremains contains a repeated region (region R) comprising 154 repeats of the dipeptide cremains of other Gram positive bacteria that are responsible for anchoring the protein to the cell wall and cell membrane. Ciff, or its framments, may be used to block S. aureus colonisation of wounds, to provent adherence of S. aureus to indwelling medical devices, as vaccines to protect against S. aureus infection (e.g., mastitis in runnants), to raise specific antibodies, and for diagnosis (by runnants).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and

Staphylococcus aureus

```
binding protein. It is useful as a vaccine to protect against human and animal infections caused by S.aureus, such as against mastilis, to block S.aureus from colonising and infecting a wound, to block adherence of S.aureus to indwelling medical devices such as catheters, replacement heart valves and cardiac assist devices. The protein can be used to diagnose batterial infections. Polyclonal and monoclonal antibodies raised against the fibrinogen binding protein are useful for passively immunising against infections caused by S.aureus, to prevent infection of a wound and to diagnose bacterial infections.
                                                                                                                                                                   --SSDSDSESDSNSDSESGSNNNVVPPNSPKNGTNA 883

Sure). Staphylococcus aucusus is thought to utilize fibrinogen to adhere to medical devices binding proteins that bind both the alpha and beta fibrinogen chains (clfb, SdrC, SdrD and SdrE) can therefore be used as competitive inhibitors to block this binding. Antibodies against clfb, SdrC, SdrD and SdrE mediated binding. The proteins of the invention can be used in a pharmaceutical composition for the treatment of Staphylococcus aureus infection e.g. septicemia, osteomyelitis, mastitis or endocarditis or to inhibit the binding of S. aureus to the extracellular matrix. The proteins or their fragments may be used to coat a medical device to reduce the S. aureus infection of an indwelling medical device, especially where the medical device is selected from the group consisting of vascular grafts, vascular stents, intravence at partificial heart valves, and cardiac assist devices. Clfb, SdrC, SdrD, SdrE, or an active fragment, subdomman or encoding gene may be used as a vaccine. The DS (appartate serine) repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   region or a gene encoding it may be used as an identifying probe for the identification of genes and encoding proteins from Staphylococcus aureus (other than CIEA), S. hemolyticus, S. lugdenensis, and S. schleriferi. The proteins of the invention have antibacterial activity.
                                                                                            Staphylococcus aureus fibrinogen-binding
                                                                                                                                                      (and their encoding nucleic acids are ClfB, SdrC, SdrD and
                                                                                   This invention describes novel Staphylococcus aureus fibrinoc proteins that bind both the alpha and beta fibrinogen chains

skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the 5191 S aureus DNA sequences contained on the computer readable medium.

936 AA;

Sequence

This sequence represents a Staphylococcus aureus protein sequence of the invention. The DNA sequences encoding the S.aureus proteins are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, for polysoning, osteomyelitis, skin and surgical wound infections, scaled in a sample of the surface of the standard with the second of the standard with the second of the standard with the second of the standard of the standard of the standard of the second of the standard of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying ene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA11355-BAB41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wipo at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein #2883 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single exon nucleic acid probes for analyzing gene expression in human
